## 1 .Features of TR Ball Bearing Units

Spherical outside surface ball bearing units consist of inserts and housings, based on the methods of mounting the units to shafts, they can be divided into three types: the setscrews type, the adapter sleeve locking type and the eccentric locking collar type.

The housings have two types: Grey or Ductile Cast iron housings and pressed steel plate housings.

Spherical outside surface self-aligning ball bearing units are compact in design with perfect sealing devices.

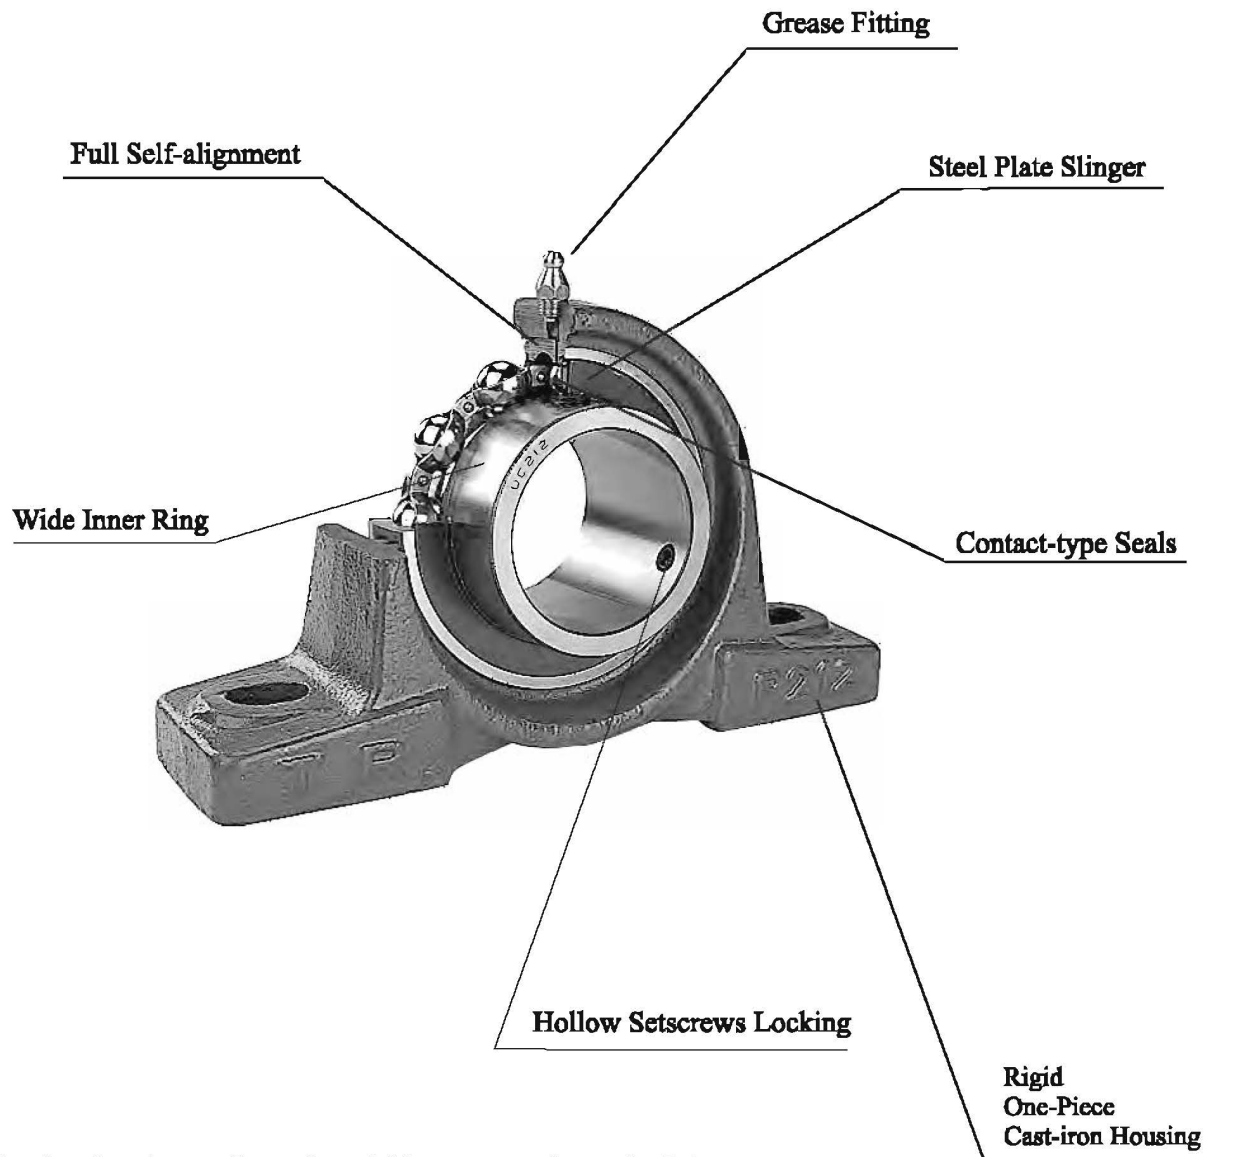

All TR ball bearing units have contact-type seals at both sides. The seals will vary according to the different types of bearings. By selecting the sealing devices, which is most suitable to the application condition, long bearing life can be guaranteed.

Sealing Devices:

Table 1.

<p>Single-layer seal</p> 	<p>Synthetic rubber is baked to the core piece. It is inserted into the groove of the outer ring and then fitted on the inner ring outer diameter, thus it has low friction, high property in oil resistance and good mechanical stability.</p>
<p>Single-layer seal</p> 	<p>This consists of a pressed steel seal with a vulcanized synthetic rubber sealing lip baked inside. The seal forms a tiny clearance with the outer diameter of the inner ring, thus can provide efficient protection against the dust, sand or other contaminants.</p>
<p>Dual seals</p> 	<p>Oil seal is fixed in the outer ring inner diameter groove, and the slinger is set at the inner ring outer surface. In addition, the simultaneous revolution with inner ring generates the wind pressure for dust-proof property. This constitutes the ideal labyrinth, so effective dust-proof property can be guaranteed.</p>
<p>F Seal</p> 	<p>This type encloses a synthetic rubber washer between two metal caps. Due to the three pieces design with protective outer shroud ,the sealing is excellent.</p>
<p>Triple-lid seal</p> 	<p>This type consists of a metal cap and synthetic rubber seal, which are baked together to form a single seal. Seal lips have enough tightening allowance. In addition, the lip layers are of triple construction and outside matters, such as dust, water, etc., are shut out. This sealing system shows its outstanding function under bad conditions.</p>

## 2. Structure of Pillow Blocks

- Cast iron housing ... of one-piece rigid structure and easy for fixing.
- Wide inner ring ... for rigidity and more effective setscrews locking.
- Hollow setscrews ... two hollow setscrews 120° apart on the inner ring ensure easy and firm mounting on a shaft. Inner ring has been treated through special heat treatment.
- Steel plate slinger ... one on each side of the bearing by which dust can be efficiently excluded.
- Contact-type seals ... at both sides of bearing units.
- Grease fitting ... from which grease can be added .
- Full Self-alignment... when the bearing undergoes inevitable deformations or proper alignment can not be achieved during mounting.

4. Ball Bearing Inserts

The spherical outside ball bearing inserts are sealed at both sides. The internal structure dimensions, chromium bearing steel balls and retainers are same as those of the deep groove ball bearings.

4.1 Material of Bearing Rings and Balls.

The bearing rings and balls are made of GCr15 chromium bearing steel of which the chemical composition are shown in table 2.

Table 2. (%)

C	Cr	Si	Mn	S	P
0.95-1.05	1.30-1.65	0.15-0.35	0.20-0.40	≤0.020	≤0.027

The hardness of the bearing ring is 59HRC~64HRC, of the ball is 61HRC~66HRC, with high wear resistance and contact fatigue strength.

The inner rings of setscrew type bearings(US,RB,SB,CSB,ER,SER series)are special heat treated .Therefore,the raceway of the inner ring is hardened completely through the ring,while the setscrews hole zone on the extended ends of the inner rings are softened ,so that the setscrew hole zone would not break under high torque.

## 4.2 Bearings Tolerances

### 4.2.1 Outer Rings Tolerances

The outer rings tolerances, which are shown in Table 3 , are the same as those for deep groove bearings.

**Table 3. Outer rings tolerances (  $\mu\text{m}$  )**

## 6. Selection of Ball Bearing Units

The bearing size is usually selected according to the load applied to the bearing, the required bearing life and reliability. As a technical index of the bearing capacity, there are two types of basic load rating: basic dynamic load rating and basic static load rating.

The load applied to the bearing when operating under rapid rotation ( $n > 10r/\text{min}$ ) is defined as basic dynamic load rating  $C$ , while the load applied to the bearing when operating under static circumstances, slow rotation or oscillation ( $n \leq 10n/\text{min}$ ) is defined as basic static load rating  $C_0$ .

Ball bearings are classified as concentric bearings because they mainly bear radial force. Therefore, the load applied to the bearing is called radial basic dynamic load rating  $C_r$ , or radial basic static load rating  $C_{0r}$ .

The above two load ratings  $C_r$  and  $C_{0r}$  are shown in the bearing tables (page C-1~C-19).

Normally, the life of a rolling bearing is an important element of selecting bearings. Here the usually said bearing life refers to the bearing fatigue life. If the bearing operates properly (with suitable load, correct mounting and fine lubrication), the main damage would be fatigue flaking due to the repeating action of variable load charged on the contact area, which is inevitable. However, with different applications and demands, damages can also come from increasing noise and vibration, inaccuracy caused by abrasion, and lubricating grease aging after some time's operation. The bearing will be disabled or fail to meet a specific kind of mechanical demand under such damages. The life before disability is defined respectively as noise life, abrasion life, and lubricating grease life.

Beside the above lives, the bearing can also be disabled by sintering, breakage or cracking, sealing failure, etc. These should be defined as bearing failure. It can be caused by inappropriate choice of bearings, faulty design, mounting, operation and maintenance, which should be distinguished from the bearing life.

### 6.1 Basic Load Rating and Life

**Basic dynamic load rating:** The basic dynamic load rating is defined as the constant load applied to a bearings with stationary outer rings that the inner rings can endure for a rating life of one million revolutions ( $10^6$  rev.).

**Life:** The life of a rolling bearing is defined as the total number of revolutions which the bearing is capable of enduring before the first evidence of fatigue flaking develops on any one of the rings or rolling elements.

**Reliability :** The reliability is the percentage of the bearing of a group of apparently identical bearings operating under identical conditions which can expect to attain or exceed a certain defined life. The reliability of an individual bearing is the probability of the bearing to attain or exceed a defined life.

**Basic rating life  $L_{10}$  :** For a group of apparently identical rolling bearings operating under identical conditions, the basic rating life is defined as the total number of revolutions that 90% of the bearings can be expected to complete or exceed.

The basic rating life  $L_{10}$  estimation for ball bearings with different speeds and  $\frac{C_r}{P_r}$  ratios is shown in page A-32.

## 6.2 Bearings Selection According to Basic Dynamic Load Rating

### 6.2.1 Basic Rating Life

The fatigue rating of deep groove ball bearings is calculated by following formula:

$$L_{10} = \left( \frac{C}{P} \right)^3$$

$$\text{or } \frac{C}{P} = L_{10}^{1/3}$$

Where  $L_{10}$  = basic rating life ( $10^6$  r )

$C$  = basic dynamic load rating (N)

$P$  = equivalent dynamic bearing load (N)

The basic dynamic load rating  $C$  is a hypothetical constant load with a fixed direction under which the bearing can attain a basic rating life of one million revolutions. For radial bearing, the load refers to the radial load.

The equivalent dynamic bearing load  $P$  is a constant load with a fixed direction under which the bearing life is identical to that of the bearing operating under actual load.

For a bearing operating with a constant rotation speed ,  
the basic rating life can be expressed in terms of operating hours:

$$L_{10h} = \frac{10^6}{60n} \left( \frac{C}{P} \right)^3$$

OR

$$L_{10h} = \frac{10^6}{60n} L_{10}$$

$$\frac{16666}{n} \left( \frac{C}{P} \right)^3$$

Where  $L_{10h}$  = basic rating life (h)

$n$  = bearing operating speed of rotation (r/min)

For easier calculation, 500 hours as base of rating life is taken,  
and the speed factor  $f_n$  and the life factor  $f_h$  is introduced :

$$f_n = \left( \frac{33\frac{1}{3}}{n} \right)^{1/3}$$

$$f_h = \left( \frac{L_{10h}}{500} \right)^{1/3}$$

In this way, the formula is simplified to

$$C = \frac{f_h}{f_n} P$$

The values of  $f_n$  and  $f_h$  can be found in Fig.1 by referring to the operation speed  $n$  and the anticipated bearing service life  $L_{10h}$ . Then, with the radial load (or the equivalent dynamic bearing load ), the basic dynamic load rating can be determined. By this way, the bearing size can be determined according to the basic dynamic load rating value in the bearings Table.(Please refer to page C-1~C-19).

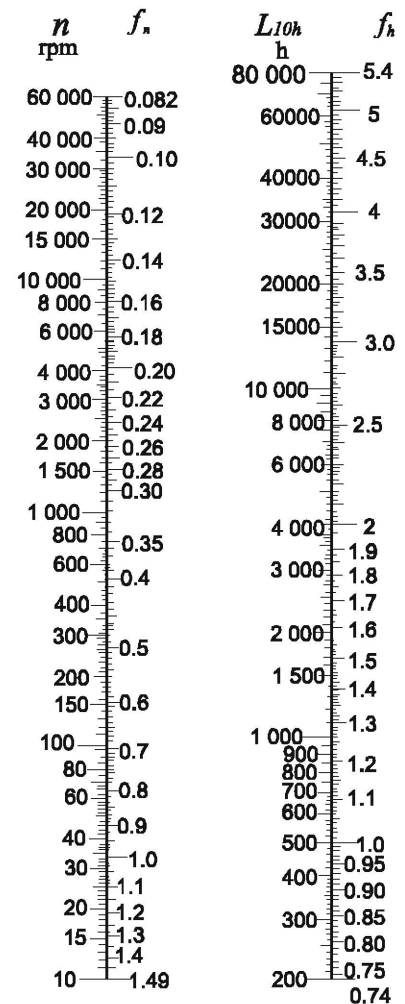

Fig.1

If the bearing operates under indeterminate loads and rotation speed, the following formula should be applied when calculating the bearing life:

$$P_m = \sqrt[3]{\frac{1}{N} \int_0^N P^3 dN}$$

Where  $P_m$  = mean equivalent dynamic bearing load (N)

$P$  = equivalent dynamic bearing load (N)

$N$  = total revolution numbers within one load changing cycle ( r )

### 6.2.2 Anticipated Bearing Service Life

When selecting a bearing, one should usually predetermine an appropriate service life according to the relevant machine type, operating conditions and reliability requirement. Generally speaking, the anticipated bearing service life can be determined by referring to the maintenance period of a machine.

### 6.2.3 Calculation Method of Equivalent Dynamic Bearing Load P

The basic equivalent dynamic bearing load is determined under a hypothetical condition. When calculating the bearing life, the actual load has to be converted into equivalent dynamic bearing load which is in conformity with the load condition determining the equivalent dynamic load rating.

General equation for calculating the equivalent dynamic bearing load:

$$P = X F_r + Y F_a$$

Where:  $P$  = equivalent dynamic bearing load (N)

$F_r$  = actual radial load (N)

$F_a$  = actual axial load (N)

$X$  = radial factor

$Y$  = thrust factor

The values of X and Y are determined by the ratio between the applied axial load  $F_a$  and the basic static load rating  $C_0$ . The axial load which the spherical outside surface bearings can carry is determined by the mounting method of the bearings on the shafts.

For the setscrews locking type or eccentric locking collar type bearings, if flexible shafts are applied and the setscrews are tightened enough (See Table 34 for reference torque), the axial load  $F_a$  which the bearing can carry must not surpass 20% of the radial load  $F_r$ .

For the adapter sleeve locking type bearing, if the nuts are properly tightened, the axial load  $F_a$  can be maximum 15% to 20% of the radial load.

The values of radial and thrust factors X and Y for spherical outside surface ball bearings can be obtained from the following table:

Table 20.

$\frac{F_a}{C_0}$	$\frac{F_a}{F_r} \leq e$ $p = F_r$		Clearance for group 2			Clearance for normal group			Clearance for group 3		
			$\frac{F_a}{F_r} > e$		e	$\frac{F_a}{F_r} > e$		e	$\frac{F_a}{F_r} > e$		e
	X	Y	X	Y		X	Y		X	Y	
0.025	1	0	0.56	2.0	0.22	0.46	1.75	0.31	0.44	1.42	0.4
0.04	1	0	0.56	1.8	0.24	0.46	0.62	0.33	0.44	1.36	0.42
0.07	1	0	0.56	1.6	0.27	0.46	1.46	0.36	0.44	1.27	0.44
0.13	1	0	0.56	1.4	0.31	0.46	1.30	0.41	0.44	1.16	0.48
0.25	1	0	0.56	1.2	0.37	0.46	1.14	0.46	0.44	1.05	0.53
0.5	1	0	0.56	1	0.44	0.46	1	0.54	0.44	1	0.56

When twist load is applied to the bearings, the equivalent dynamic bearing load is calculated by:

$$P_m = f_m \cdot P$$

Where  $P_m$  = equivalent dynamic bearing load when considering twist load

$f_m$  = twist load factor, which is defined as follows:

when the twist load is small:  $f_m = 1.5$

when the twist load is big:  $f_m = 2$

When shocking load is applied to the bearings, the equivalent dynamic bearing load can be calculated by the following equation:

$$P_d = f_d \cdot P$$

Where  $P_d$  = equivalent dynamic bearing load when considering shocking load

$f_d$  = shocking load factor, which is defined as follows:

When no shocking load or minor shocking load is applied:

$$f_d = 1 \sim 1.2$$

When adequate shocking load is applied:

$$f_d = 1.2 \sim 1.8$$

### 6.3 Example of Bearing Size Selection

One ball bearing is to operate at a rotation speed of 1000 r/min under only a radial load of  $F_r = 3000$  N, with a basic rating life of at least 20000 hours, select the bearing size.

From the required rotation speed, it can be found that:

$$f_n = 0.322 \text{ ( Fig 1. shows about 0.32 )}$$

From the required basic rating life (anticipated service life), at least 20000 hours, it can be found that:

$$f_h = 3.42 \text{ (Fig 1. shows about 3.4)}$$

Under only a radial load, i.e.,

$$P = F_r = 3000 \text{ (N)}$$

Therefore,

$$C = \frac{f_h}{f_n} P = \frac{3.42}{0.322} \times 3000 = 31863 \text{ (N)}$$

A simplified way to calculate the bearing life can be applied by using Fig 2.

Fig.2

By connecting  $n(1000r/min)$  and the required basic rating life  $L_{10h}$  (20000 hours) with a straight line, it can be found that  $C/P$  value is 10.6, As is known,  $P = F_r = 3000 \text{ N}$ , thus the required basic dynamic load rating is:

$$\begin{aligned} \frac{C}{P} &= 10.6 \\ C &= 10.6P \\ &= 10.6 \times 3000 = 31800 \text{ (N)} \end{aligned}$$

In this way, we can select the bearing from the bearing table. (Please refer to page C-1 ~ C-19)

#### 6.4 Adjusted Rating Life Equation

The basic rating life  $L_{10}$  calculated with the bearing life calculation formula can be applied to calculate the rating life of bearings made of ordinary bearings steel ( i.e., bearing life with reliability of 90%.)

But some occasions may require a more accurate and reliable life calculation, taking the bearing's quality and operating conditions into consideration. In this case, the adjusted rating life  $L_{nm}$  can be applied.

The adjusted rating life  $L_{nm}$  equation is as follows:

$$L_{nm} = a_1 a_{iso} L_{10}$$

Life adjustment factor for reliability  $a_1$  is shown in Table 21.

Table 21.

Reliability	$L_{nm}$	$A_1$
90	$L_{10m}$	1
95	$L_{5m}$	0.64
96	$L_{4m}$	0.55
97	$L_{3m}$	0.47
98	$L_{2m}$	0.37
99	$L_{1m}$	0.25

Life adjustment factor for system approaches  $a_{iso}$  is defined by the following factors:

- Material (such as cleanliness, hardness, surface structure, fatigue limit, temperature response);
- Lubrication (such as viscosity, bearing rotation, bearing size, type of lubricant, additive);
- Environment (such as pollution level, humidity);
- Impurity (such as hardness, size, shape, material);
- Internal stress in the ring (during production or ring interference after mounting);
- Mounting (such as assembling and disassembling damage, non-concentricity);
- Bearing load.

It means that any changes of the above factors will affect the bearing life directly. So when selecting bearings, all kinds of factors should be taken into consideration to calculate a proper factor, so that the chosen bearing can fulfill an expected need.

## 7. Lubrication and Operating Temperature

### 7.1 Lubricants

The bearings are filled with the lubricating grease (lithium grease NO.2) that is used in large-medium size of motor bearings. Its physical and chemical properties are shown in Table 22.

Table 22.

Density (1/10mm)	Without operation	265~295

### 7.2 Operating Temperature.

The bearings usually operate below the temperature of 120°C (the measuring temperature of the outer ring is 100°C ). Grease life reduction has to be taken into account when the bearings continue to operate at a temperature above 70°C.

The lowest operating temperature should not be lower than -20°C.

For higher or lower temperature application, please consult us for further information.

### 7.3 Relubricate Period

Under normal operating condition, the grease should conform to the life of the bearings. Relubricatable type bearing units must be periodically greased to assure long life.

The greasing interval is dependent on the bearing running speed, operating temperatures and ambient conditions.

The following table shows the standard relubrication period.(Table 23)

Table 23.

Notes:

- (1)For TR bearings,the original amount of grease accounts for 30~40% ofthe bearing’s available volume. It is suggested that the amount of filling grease should refer to the original amount to avoid abnormal heat or lubricating grease leak caused by excessive filling grease.
- (2)The amount of filling grease for bearings with triple seals is 1.5 times as much as the figures in the table.
- (3)For bearings operating in a low speed, to improve their dust proof capacity,the amount of filling grease can be 2 times as much as the figures in the table.

#### 7.4. Grease Fittings

TR bearing units are , as a general rule, provided with a grease fitting made of bronze or steel, as shown in Table 25.

Grease fitting dimensions and designation of applicable bearing units are given in Table 26.

### 8. Limiting Speed

The limiting speed of the ball bearing units are mainly determined by the fit between the bearings and the shafts. Under normal conditions, the fit for the setscrews type and eccentric locking collar type bearing unit is h7. h8 or h9 fit is applied when with light load and slow speed, while tighter fit j7 is applied when with heavy load and high speed. The shaft applied to the adapter sleeve bearing is h9 class, with IT5 class tolerances.

The speed ratings for ball bearing of series CS2(00)-2RS and CS3(00)-2RS are the same as deep groove ball bearings which are shown in Table 27.

The limiting speeds for the ball bearing units with different fits are shown in Table 29.

2. The limiting speeds of ball bearings units with triple seals are 20% to 25% of the above figures.

### 9. Shafts Design

The ball bearing units are provided with hexagonal setscrews to fix the shafts. Under normal operating conditions, the inner rings are mounted on shafts by means of a loose fit to ensure convenience of shaft installation. In this case, the dimensional accuracy of the shafts is shown in Table 28.

**Table 28. Dimensional accuracy of the shafts to be used in the cylindrical bore bearings (Loose fit) ( $\mu$  m)**

When the ball bearing units are used at a high speed or under heavy load, the inner rings of the ball bearings should be mounted to the shafts by means of a tight fit. As shown in Table 29.

Some bearings can be installed to the shafts by means of adapter sleeves. In this method, the bearing bore is made of 1:12 taper and the corresponding tapered adapter sleeves are applied. This is a convenient method that can be used as the intermediate bearings of a long shaft. In this case, the dimensional accuracy of shafts is shown in Table 30.

Most industrial fans operate at high speeds. The inner ring of the ball bearing units should be mounted to the shafts by means of h5 or j5 fit. As shown in following table.

## 10. Mounting of Bearings on Shafts

### 10.1 Setscrews Locking Type Bearings

There are two setscrews located at two places on one side of the wide inner ring 120° apart with which the bearings can be mounted to the shafts. When mounting the bearings to the shafts, the torque shown in the following table is recommended to tighten the setscrews to shafts.

Table 32. Proper tightening torque of setscrews

In case of either the vibration is caused to the bearing; or 1) the alternating movement takes place, 2) the load applied to the bearings is large, 3) The shafts rotation speed is rapid, it is desired to provide with the filed seat or concave section at the part where the setscrews contact with the shafts. If large thrust load is charged, it is recommended that joggling tightened with nuts be used to install the bearings most effectively to the shafts. As shown in Fig. 3.

Fig.3

## 10.2 Adapter Sleeves Locking Type Bearings

The inner ring bore of this type of bearings has a taper of 1:12. The sleeves are installed to an arbitrary position. After the shake proof washers are inserted, the correct nuts tightening condition can be obtained if they are tightened enough by hand and then rotated by 2/5 to 3/5 revolution with a spanner.

After tightening the nuts, bend the shake proof washers within the slots. Otherwise, the nuts may loosen and creep may happen between the shaft and sleeves.

It is necessary to ensure that the nuts are not over tightened. As shown in Fig. 4.

## 10.3 Eccentric Locking Collar Type Bearings

The eccentric part of the collars mates with the inner rings of the bearings which is made eccentric with the collars. When locked to the shafts by hand in direction of the shafts rotation, the eccentric locking collars tighten automatically to the shafts by force of working radial loads. Then, lock the setscrews provided on the collar to fix the eccentric collars to the shafts.

## 10.4 Mounting Method of Housings

The desired installation order is: first install the housing, then the shaft and bearing. The bearing units can be easily installed, in principle, at any place. However, in order to have a long service life, it is desired that the mounting base is flat and rigid.

The pillow block type and flange type housings are desired that the angle between the surface on which the housing is mounted and the shaft be maintained to a tolerance of  $\pm 2^\circ$  (Fig.5).

Life estimation for UC212 insert bearing with steady radial load  $F_r = 3250$  N at a speed of 1500 r/min.

The dynamic load rating  $C_r$  of the inset bearing UC212 from page C-1 is 47800 N.

Since the bearing is not subject to axial load, the equivalent load  $P_r = F_r \times f_d = 3250$  N  $\times$  1.2 = 3900 N (When no shocking load or minor shocking load, shocking load factor  $f_d = 1 \sim 1.2$ ).

Using the load ratio tables, an approximate life can be obtained by locating the nearest  $C_r/P_r$  value in the appropriate r/min column.

$$\text{Therefore for } C_r/P_r = \frac{47800}{3900} = 12.256$$

Under the  $n = 1500$  r/min column, the nearest  $C_r/P_r$  value is 12.2 with give an approximate life of 20000 hours.

# PRESSED HOUSING AGRICULTURAL DISK BEARINGS

ROUND BORE(RD)

SQUARE BORE(SQ)

The disk harrow unit is available in two basic size groups, one incorporating a 209 and one a 211 bearing, both size groups offer these outstanding features.

- ※ Dynamic alignment capability ( $\pm 3^\circ$ )
- ※ Shroud effect from close clearance of stamping to inner ring.
- ※ Relubrication.
- ※ One unit piece for ease of handling and assembly.
- ※ Fitting flange mates with outer ring milled recess, preventing possibility of outer ring circumferential movement.

(Method of using this table) For example, to convert 10kg into lb, read the figure in the right lb column adjacent to the 10 in the center column in the 1st block. This means that 10kg is 22.046 lb. To convert 10lb into kg, read the figure in the left kg column of the same row, which indicates that the answer is 4.536kg.
